

ADD MUSIC AND SOUND CLIPS

Apply audio effects to clips

iMovie includes audio effects that you can apply to [clips](#) to enhance the sound in your movies.

Add an audio effect to a clip

1. In the [browser](#) or the [timeline](#), select an audio clip, or a video clip with audio.
2. To show the effects controls, click the Video and Audio Effects button.

3. Click the Audio Effect button, and click the audio effect you want to apply to the clip.

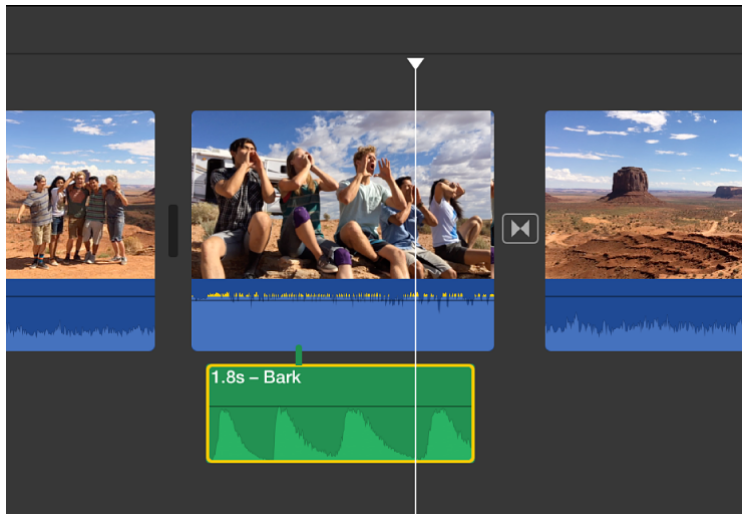

To remove an audio effect, select the clip or range containing the effect, click the Audio Effect button, and click None.

Lower the volume of other clips that play at the same time

When you have background sound or other clips with audio playing at the same time as a clip you want to hear in the foreground, you can automatically lower the volume of the other clips so that they don't compete with the clip you want to hear.

For example, if you record a section of voiceover audio, you can have iMovie lower the volume of background music and other clips while the voiceover clip plays.

1. In the [timeline](#), select the clip whose audio you want to hear in the foreground.
-

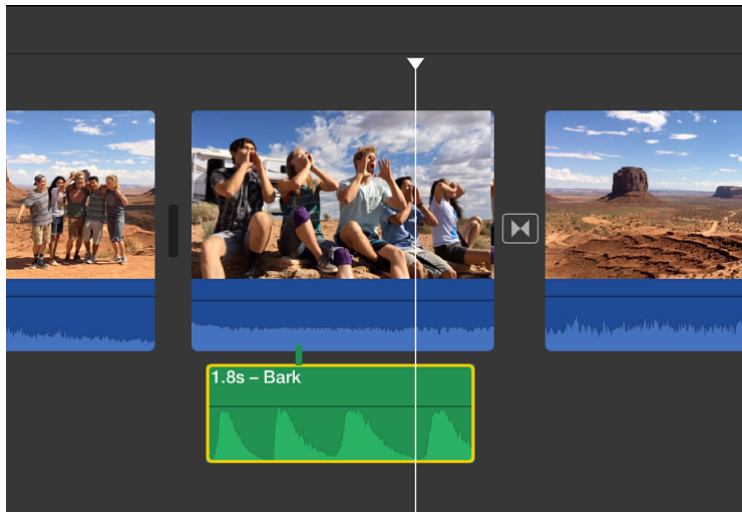

2. To show the volume controls, click the Volume button.

3. Select the “Lower volume of other clips” checkbox.

The volume of the clips that aren't selected is lowered.

4. Drag the slider to set the volume of other clips relative to the volume of the selected clip.
